Mathematical Constants and Sequences

a selection compiled by Stanislav Sýkora, Extra Byte, Castano Primo, Italy. Stan's Library, ISSN 2421-1230, Vol.II. First release March 31, 2008. Permalink via DOI: 10.3247/SL2Math08.001 This page is dedicated to my late math teacher Jaroslav Bayer who, back in 1955-8, kindled my passion for Mathematics.

PHYSICS Constants (on a separate page)

Mathematics LINKS | Stan's Library | Stan's HUB

This is a constant-at-a-glance list. You can also download a PDF version for off-line use. But keep coming back, the list is growing! When a value is followed by #t, it should be a proven transcendental number (but I only did my best to find out, which need not suffice).

Bold dots after a value are a link to the ••• OEIS ••• database.

This website does not use any cookies, nor does it collect any information about its visitors (not even anonymous statistics). However, we decline any legal liability for typos, editing errors, and for the content of linked-to external web pages.

- Basic mathematical constants ...
- ... and those derived from them
- Named math constants
- Other notable real constants
- Notable integer numbers
- Selected functions on N
- Notable integer sequences
- Combinatorial numbers
- Selected figurate numbers
- Some binary sequences
- Enumerations on sets

Roots of i, up to a term of 4k in the exponent (like $i^{4k+1/4} = i^{1/4}$, with any integer k):

- Enumerations on graphs
- Diophantine solutions / sequences
- Rational number sequences
- Geometry constants and sequences
- Platonic solids data
- Number-theoretical functions
- Selected complex functions
- · Constants useful in Sciences
- Statistics / probability constants
- Engineering constants
- Software engineering constants
- Conversion constants
- · Notes, References and Links

Basic math constants		_
Zero, One, and i	0, 1, √(-1), respectively	Can anything be more basic than these two? (Oops, three!)
π, Archimedes' constant	3.141 592 653 589 793 238 462 643 ••• #t	Circumference of a disk with unit diameter.
e, Euler number, Napier's constant	2.718 281 828 459 045 235 360 287 ••• #t	Base of natural logarithms.
γ, Euler-Mascheroni constant	0.577 215 664 901 532 860 606 512 •••	$L_{n\to\infty}\{(1+1/2+1/3+1/n) - \log(n)\}$
√2, Pythagora 's constant	1.414 213 562 373 095 048 801 688 •••	Diagonal of a square with unit side.
Φ, Golden ratio	1.618 033 988 749 894 848 204 586 •••	Φ = (1+ $\sqrt{5}$)/2 = 2.cos(π /5). Diagonal of a unit-side pentagon
$\phi,$ inverse golden ratio 1/ Φ = Φ -1 =(1- ϕ)/ ϕ	0.618 033 988 749 894 848 204 586 •••	Also $\varphi = (\sqrt{5} - 1)/2 = \sqrt{(2 - \sqrt{(2 + \sqrt{(2 - \sqrt{(2 + \dots))})})}$
δ _S , Silver ratio Silver mean	2.414 213 562 373 095 048 801 688 •••	δ_s = 1+ $\sqrt{2}$. One of the silver means (n+sqrt(n ² +1))/2
Plastic number ρ (or silver constant)	1.324 717 957 244 746 025 960 908 •••	Real root of $x^3 = x + 1$. Attractor of M(#)= $(1+#)^{1/3}$.
Aleph ₀ ≡ Beth ₀	× ₀ ≡ ₀	Cardinality of the set of natural numbers.
Beth ₁ , ₁ ≡ □, cardinality of continuum	□ = 2^ 0 > 0	Cardinality of the set of real numbers.
Beth ₂ , ₂	In general, $_{k+1} = 2^{h} _{k} > _{k}$;	Cardinality of the power set of real numbers.
Aleph ₁	ℜ1 ≤ 1, depending on axioms	The smallest cardinal number sharply greater than $ \aleph_0 . $
Constants derived from the basic ones		
Spin-offs of zero . $0^0 = 1$ is the number of mappings o	f an empty set into itself (the identity). Hence, "1" n	night be viewed as a spin-off of "0". There is only one zero!
Spin-offs of one. The best known are the natural num	bers (iterated sums of 1's) and the golden ratio, v	ria its continued fraction $\Phi = 1+1/(1+1/(1+1/()))$
$\Phi = \sqrt{(1+\sqrt{(1+\sqrt{(1+\sqrt{(1+))})})}}$; golden ratio again!	1.618 033 988 749 894 848 204 586 •••	Attractor of the mapping M1(#)= $\sqrt{(1+#)}$ in C
$\sqrt{(1+\sqrt{(0+\sqrt{(1+\sqrt{(0+))})})}} \equiv \sqrt{(1+\sqrt{\sqrt{(1+\sqrt{(1+)})})}}$	1.490 216 120 099 953 648 116 386	Attractor of the mapping M10(#)= $\sqrt{(1+\sqrt{(\#)})}$ in C
√(1+√√√(1+√√√(1+√√)))	1.448 095 838 609 641 132 583 869	Attractor of the mapping M100(#)= $\sqrt{(1+\sqrt{(\sqrt{(\#))})}}$ in C
√(-1+√(1+√(-1+√(1+))))	0.453 397 651 516 403 767 644 746 •••	Attractor of the mapping M(#)= $\sqrt{(-1+\sqrt{(1+\#)})}$ in C
√(1+√(-1+√(1+√(-1+))))	1.205 569 430 400 590 311 702 028 •••	Attractor of the mapping M(#)= $\sqrt{(1+\sqrt{(-1+\#)})}$ in C
Spin-offs of the imaginary unit i . Formally, i is a soluti	on of $z^2 = -1$ and of $z = e^{z\pi/2}$. Hence, for any integration	ger k, $i^{2k} = (-1)^k$ and, for any z, $i^{4k+z} = i^z$
$i^{i} = e^{-\pi/2}$	0.207 879 576 350 761 908 546 955 ••• #t	the imaginary unit elevated to itself is real
$i^{-1} = (-1)^{-i/2} = e^{\pi/2}$	4.810 477 380 965 351 655 473 035 ••• #t	Inverse of the above. Square root of Gelfond's constant .
$\log(\mathbf{i}) / \mathbf{i} = \pi/2$	1.570 796 326 794 896 619 231 321 ••• #t	Imaginary part of log(log(-1))
i!=Γ(1+i)=i*Γ(i) (see Gamma function)	0.498 015 668 118 356 042 713 691 •••	- i 0.154 949 828 301 810 685 124 955 •••
i ! , absolute value of the above	0.521 564 046 864 939 841 158 180 •••	arg(i!) = -0.301 640 320 467 533 197 887 531 ••• rad
$i^i^i^i$ infinite power tower of i; solution of $z = i^z$	0.438 282 936 727 032 111 626 975 •••	+i 0.360 592 471 871 385 485 952 940 •••
i^i^i^i , absolute value of the above	0.567 555 163 306 957 825 384 613 •••	arg(i^i^i^) = 0.688 453 227 107 702 130 498 767 ••• rad
Continued fraction c(i) = i/(i+i/(i+i/()))	0.624 810 533 843 826 586 879 804 •••	+i 0.300 242 590 220 120 419 158 909 ••• attractor of i/(i+#)
Continued fraction $f(i) = i/(1+i/(1+i/()))$	0.300 242 590 220 120 419 158 909 •••	+i 0.624 810 533 843 826 586 879 804 ••• attractor of i/(1+#
Shared modulus c(i) = f(i)	0.693 205 464 623 797 320 434 363 •••	Note that i/(1+i/(1+i/())) = i*conjugate[i/(i+i/(i+i/()))]
Infinite nested radical $r(i) = \sqrt{(i+\sqrt{(i+\sqrt{(i+\dots)})})}$	1.300 242 590 220 120 419 158 909 •••	+i 0.624 810 533 843 826 586 879 804 ••• (note: r(i) = 1+f(i))
Modulus $ \sqrt{(i+\sqrt{(i+\sqrt{(i+))})} $ of $r(i)$	1.442 573 740 446 059 678 174 681	r(i) is an attractor of the mapping M(#) = sqrt(i+#)
Infinite nested power $p^+(i) = (i+(i+(i+)^i)^i)^i$	0.269 293 437 169 311 227 190 868	+i 0.012 576 454 573 863 832 381 561
Modulus $ (\mathbf{i}+(\mathbf{i}+(\mathbf{i}+)^{\mathbf{i}})^{\mathbf{i}} ^{\mathbf{i}} $ of $p^+(\mathbf{i})$	0.269 586 947 963 194 676 106 659	$p^+(i)$ is an attractor of the mapping M(#) = $(i+#)^i$
Infinite nested power $p^{-}(i) = (i+(i+(i+)^{-i})^{-i})^{-i}$	1.339 209 168 529 111 968 359 269	+i 0.5 (exact) p ⁻ (i) is the invariant point of M(z)=(i+z) ⁻ⁱ
Modulus (i+(i+) ⁻ⁱ) ⁻ⁱ of p ⁻ (i)	1.429 503 828 981 383 114 270 109	$p^{-}(i)$ is also an attractor of the mapping $M'(\#) = (\# + (i + \#)^{-i})$
De Moivre numbers e ^{i2πk/n}	+	1. 3 . 7 . 7 /

$\mathbf{i}^{1/2} = \sqrt{\mathbf{i}} = (1 + \mathbf{i})/\sqrt{2} = \cos(\pi/4) + \mathbf{i}.\sin(\pi/4)$	0.707 106 781 186 547 524 400 844 •••	+i 0.707 106 781 186 547 524 400 844 •••
$i^{1/3} = (\sqrt{3} + i)/2 = \cos(\pi/6) + i.\sin(\pi/6)$	0.866 025 403 784 438 646 763 723 •••	+i 0.5
$i^{1/4} = \cos(\pi/8) + i.\sin(\pi/8)$	0.923 879 532 511 286 756 128 183 •••	+i 0.382 683 432 365 089 771 728 459 •••

	1	1
Cahen's constant C	0.643 410 546 288 338 026 182 254 •••	$C = S_{k \ge 0} \{(-1)^k / (s_{k-1})\}$, where s_k is the Sylvester 's sequence
Catalan's constant C	0.915 965 594 177 219 015 054 603 •••	$C = S_{k \ge 0} \{ (-1)^{k^2} \}$
Champernowne constant C ₁₀ (10-normal number)	0.123 456 789 101 112 131 415 161 ••• #t	String concatenation of natural numbers in base 10
Copeland-Erdös constant (a 10-normal number)	0.235 711 131 719 232 931 374 143 •••	String concatenation of prime numbers in base 10
Conway's constant $\lambda(3)$	1.303 577 269 034 296 391 257 099 •••	Growth rate of derived look-and-say strings
Delian constant	1.259 921 049 894 873 164 767 210 •••	2 ^{1/3} . The name refers to the Oracle on island Delos.
Dottie number	0.739 085 133 215 160 641 655 312 ••• #t	The only real solution of $x = cos(x)$
Embree - Trefethen constant β	0.70258 ••• (?)	Theory of 2nd order recurrences with random add/subtract
Erdös - Borwein constant	1.606 695 152 415 291 763 783 301 •••	$S_{n>0}\{1/(2^n-1)\}$
$\textbf{Feigenbaum} \ reduction \ parameter \ \alpha$	-2.502 907 875 095 892 822 283 902 •••	Appears in the theory of chaos
Feller - Tornier constant F	0.661 317 049 469 622 335 289 765 •••	$F = (1+P_{prime p}\{1-2/p^2\})/2$. See also
Often (mis)labeled as Feller - Tornier's:	0.322 634 098 939 244 670 579 531 •••	$P_{\text{prime p}}\{1-2/p^2\}.$
$\textbf{Feigenbaum} \ \text{bifurcation velocity} \ \delta$	4.669 201 609 102 990 671 853 203 ••• #t	Appears in the theory of chaos
Flajolet-Odlyzko constant	0.757 823 011 268 492 837 742 175 •••	2 I _{t=0,∞} {1-exp(Ei(-t)/2)}
Foias constant α	1.187 452 351 126 501 054 595 480 •••	$x_{n+1}=(1+1/x_n)^n$ converges for all $x_1>0$ except $x_1=\alpha$
Foias-Ewing constant β	2.293 166 287 411 861 031 508 028 •••	Attractor of f(#)=(1+1/#)#; converges for any starting x>0
Fransén-Robinson constant	2.807 770 242 028 519 365 221 501 •••	$I_{X=0,\infty}\{1/\Gamma(x)\};$ see Gamma function
Gauss' constant G	0.834 626 841 674 073 186 814 297 •••	1/AGM(1,√2); AGM is the Arithmetic-Geometric mean
Gauss-Kuzmin-Wirsing constant λ_1	0.303 663 002 898 732 658 597 448 •••	2nd eigenvalue of GKW functional operator (first is 1)
Gelfond's constant	23.140 692 632 779 269 005 729 086 ••• #t	$e^{\pi} = (-1)^{-1}$
Gelfond-Schneider constant	2.665 144 142 690 225 188 650 297 ••• #t	2√2
The last two constants are sometimes said	Hilbert's since he named them	in his famous 1900 Mathematical Problems address
Gerver's moving sofa constant	2.219 531 668 871 97 (? largest so far)	A sofa that can turn unit-width hallway corner
Hammersley's lower bound on Gerver's const.	2.207 416 099 162 477 962 306 856 •••	$\pi/2 + 2/\pi$. Also the mean angle of a random rotation.
Gibbs constant G	1.851 937 051 982 466 170 361 053 •••	$Si(\pi), I_{x=0,pi;} \{sin(x)/x\}.$
Wilbraham-Gibbs constant G'	1.178 979 744 472 167 270 232 028 •••	2G/π. Quantifies Gibbs effect in Fourier Transform.
Glaisher-Kinkelin constant A	1.282 427 129 100 622 636 875 342 •••	exp(1/12 -ζ(-1)). Appears often in number theory
Kinkelin constant	-0.165 421 143 700 450 929 213 919 •••	$1/12$ -In(A) = ζ (-1). Unstable nomenclature.
Golomb-Dickman constant λ	0.624 329 988 543 550 870 992 936 •••	Average longest cycle length in random permutations
Gompertz constant G	0.596 347 362 323 194 074 341 078 •••	G = -e.Ei(-1), Ei(x) being the exponential integral
Graham's constant G(3)	0.783 591 464 262 726 575 401 950 •••	Digits of 3^k, read backwards, for k->infinity
Grossmann's constant	0.737 338 303 369 29 ••• (?)	The only x for which $\{a_0=1; a_1=x; a_{n+2}=a_n/(1+a_{n+1})\}$ converges
Heat - Brown - Moroz constant	0.001 317 641 154 853 178 109 817 •••	$P_{\text{prime p}}\{(1-1/p)^7(1+(7p+1)/p^2)\}$
Khinchin's constant K ₀	2.685 452 001 065 306 445 309 714 •••	$P_{n\geq 1}\{(1+1/(n(n+2)))^{\log_2(n)}\}$. Limit geom.mean of cont.fract. terms
Khinchin-Lévy constant β	1.186 569 110 415 625 452 821 722 •••	$\beta = \pi^2/(12.\ln 2) = \mathbf{S}_{k \ge 1}\{(-1)^{k+1}/k^2\}/\mathbf{S}_{k \ge 1}\{(-1)^{k+1}/k\} = \eta(2)/\eta(1)$
Lévy constant γ	3.275 822 918 721 811 159 787 681 •••	$\gamma = e^{\beta} = \exp(\pi^2/(12.\ln 2))$. Unstable nomenclature
Knuth's random-generators constant	0.211 324 865 405 187 117 745 425 •••	(1-1/√3)/2
Kolakoski constant γ	0.794 507 192 779 479 276 240 362 •••	Related to Kolakoski sequence
Komornik-Loreti constant q	1.787 231 650 182 965 933 013 274 ••• #t	Least x such that $\mathbf{S}_{k>0}\{a_k/x^k\}=1$ for a unique sequence $\{a_k\}$
Landau-Ramanujan constant	0.764 223 653 589 220 662 990 698 •••	Related to the density of sums of two integer squares
Lagrange numbers $L_1 = \sqrt{5}$, $L_2 = \sqrt{8}$, $L_3 = (\sqrt{221})/5 =$	2.973 213 749 463 701 104 522 401 •••	L _n = sqrt(9-4/M(n)^2), M(n) being n-th Markov number
Laplace limit constant λ	0.662 743 419 349 181 580 974 742 •••	Let $\eta = \sqrt{(1+\lambda^2)}$; then $\lambda e^{\eta} = 1+\eta$ Click here for more
Lieb's square ice constant	1.539 600 717 839 002 038 691 063 •••	(8/9)√3. Counting directed graphs. Related to ice lattice
Twenty-Vertex entropy constant	2.598 076 211 353 315 940 291 169 •••	(3/2)√3. As above, but for triangular lattices
Linnik's constant L	1 ≤ L ≤ 11/2, that is all we know	Regards primes in integer arithmetic progressions
Liouville's constant	0.110 001 000 000 000 000 000 001 ··· #t	S _{n>0} {10^(-n!)}
Loch's constant	0.970 270 114 392 033 925 740 256 •••	6.log(2).log(10)/π ² ; convergence rate of continued fractions
Madelung's constant M ₃	-1.747 564 594 633 182 190 636 212 •••	M3 = $\mathbf{S}_{i,j,k}\{(-1)^{i+j+k}/sqrt(i^2+j^2+k^2)\}$
Meissel - Mertens constant B ₁	0.261 497 212 847 642 783 755 426 •••	$L_{\text{n}\to\infty}\{\mathbf{S}_{\text{prime }p\leq n}\{1/p\}-\log(\log(n))\}$
Meissel - Mertens constant is also known as	Kronecker constant, and as	Hadamard - de la Vallee-Poussin constant
Mills' constant θ	1.306 377 883 863 080 690 468 614 •••	Smallest θ such that floor(θ ^A 3 ⁿ) is prime for any n
Minkowski-Bower constant b	0.420 372 339 423 223 075 640 993 •••	For Minkowski question-mark function, a solution of ?x = x
MRB constant (after Marvin R. Burns)	0.187 859 642 462 067 120 248 517 •••	S _{k>0} {(-1) ^k (k ^{1/k} - 1)}
Oscillatory-integral MRB constant, modulus	0.687 652 368 927 694 369 809 312 •••	abs $(L_{n\to\infty}\{I_{x=1,2n}\{e^{i\pi x} x^{1/x}\}\})$. Note: $e^{i\pi x} \equiv (-1)^x$
Oscillatory-integral MRB constant, real part	0.070 776 039 311 528 803 539 528 •••	real($L_{n\to\infty}\{I_{x=1,2n}\{e^{i\pi x}x^{1/x}\}\}$), also called MKB constant

Murata's constant	2.826 419 997 067 591 575 546 391 •••	$P_{\text{prime p}}\{1+1/(p-1)^2\}$
Niven's constant C	1.705 211 140 105 367 764 288 551 •••	Mean maximal exponent in prime factorization
Norton's constant B for Euclid's GCD algorithm	0.065 351 425 923 037 321 378 782 •••	for 1≤n,m≤n, GCD(n,m) takes av. (12.log(2)/π²)log(n)+B step
Odlyzko-Wilf constant K	1.622 270 502 884 767 315 956 950 •••	When $x_0=1$, $x_{n+1}=ceil(3x_n/2)$, then $x_n=floor(K.(3/2)^n)$
Omega constant W(1)	0.567 143 290 409 783 872 999 968 •••	Root of (x-e ^{-x}) or (x+log(x)). See also.
Otter's constant α	2.955 765 285 651 994 974 714 817 •••	Appears in enumeration of rooted and unrooted trees:
Otter's asymptotic constant β _{II}	0.534 949 606 1(?) •••	for unrooted trees: UT(n) $\sim \beta_u \alpha^n n^{-5/2}$
Otter's asymptotic constant β _r	0.439 924 012 571 (?) •••	for rooted trees: RT(n) ~ $\beta_r \alpha^n n^{-3/2}$ (V. Kotesovec)
Pogson's ratio	2.511 886 431 509 580 111 085 032 •••	100 ^{1/5} ; in astronomy 1 stellar magnitude brightness ratio
Polya's random-walk constant p ₃	0.340 537 329 550 999 142 826 273 •••	Probability a 3D-lattice random walk returns back. See also
Porter's constant C	1.467 078 079 433 975 472 897 798 •••	Arises analyzing efficiency of Euclid's GCD algorithm
Prévost's constant (reciprocal Fibonacci)	3.359 885 666 243 177 553 172 011 •••	Sum of reciprocals of Fibonacci numbers
Reciprocal even Fibonacci constant	1.535 370 508 836 252 985 029 852 •••	Sum of reciprocals of even-indexed Fibonacci numbers
Reciprocal odd Fibonacci constant	1.824 515 157 406 924 568 142 158 •••	Sum of reciprocals of odd-indexed Fibonacci numbers
Prince Rupert's cube constant	1.060 660 171 779 821 286 601 266 ***	(3√2)/4. Side of largest cube passing through a unit cube
Ramanujan-Soldner's constant μ	1.451 369 234 883 381 050 283 968 •••	Positive real root of logarithmic integral li(x).
Rényi's parking constant m	0.747 597 920 253 411 435 178 730 •••	Linear space occupied by randomly parked cars
Robbins, or cube line picking constant Δ(3)	0.661 707 182 267 176 235 155 831 •••	Average length of a random line inside a unit 3D cube
Salem number σ ₁	1.176 280 818 259 917 506 544 070 •••	Related to the structure of the set of algebraic integers
Sarnak's constant	0.723 648 402 298 200 009 408 849 •••	Related to the structure of the set of algebraic integers $P_{\text{prime p} \ge 3} \{1 - (p+2)/p^3\}$
		Prime p≥3{1-{P+2}/P}} e ²
Schwarzschild constant, or conic constant	7.389 056 098 930 650 227 230 427 ••• #t	
Shall-Wilson or twin primes constant Π ₂	0.660 161 815 846 869 573 927 812 •••	$P_{\text{primes p} \ge 3\{1-1/(p-1)^2\}}$
Sierpinski constant S	0.822 825 249 678 847 032 995 328 •••	$S = \log(4*\pi^3 e^{2\gamma}/\Gamma^4(1/4))$
and Sierpinski constant K = πS	2.584 981 759 579 253 217 065 893 •••	Related to decompositions of n into k squares
Somos' quadratic recurrence constant σ	1.661 687 949 633 594 121 295 818 •••	$\sigma=\sqrt{(1/(2\sqrt{3}))}$. Somos's sequence tends to $\sigma^{(2^n)}/(n+2)$
Stieltjes constants γ _n :	For values, click here	Coefficients of the expansion of Riemann's ζ(s) about s=1
Taniguchi's constant	0.678 234 491 917 391 978 035 538 •••	$P_{\text{prime p}}\{1-3/p^3+2/p^4+1/p^5-1/p^6\}$
The odorus' constant	1.732 050 807 568 877 293 527 446 •••	√3.
Thue-Morse constant	0.412 454 033 640 107 597 783 361 ••• #t	Thue-Morse sequence as a binary number .0110
Viswanath's constant	1.131 988 248 794 3 ••• (?)	Growth of Fibonacci-like sequence with random +/-

Notable interesting integers	•	
Ishango bone prime quadruplet	11, 13, 17, 19	Crafted in the paleolithic Ishango bone
Hardy-Ramanujan number	$1729 = 1^3 + 12^3 = 9^3 + 10^3$ (see A080642)	Smallest cubefree taxicab number T(2); see below
Heegner numbers h (full set)	1, 2, 3, 7, 11, 19, 43, 67, 163 (see A003173)	The quadratic ring $Q(\sqrt{-h})$ has class number 1
Vojta's number	15170835645 (see A023050)	Smallest cubefree T(3) taxicab number (see the link)
Gascoigne-Moore number	1801049058342701083 (see A080642)	Smallest cubefree T(4) taxicab number (see the link)
Tanaka's number	906150257 (see A189229)	Smallest number violating Polya conjecture that L(n>1)≤0
	900130237 (See A103223)	Smallest number wording Polya Conjecture that L(11/1)20
Smallest of	70557 (4070200)	
Sierpinsky numbers	78557 (see A076336)	m is a Sierpinsky number if m*2 ^k +1 is not prime for any k>0.
Riesel numbers (conjectured!)	509203 (see A076337)	m is a Riesel number if m*2 ^k -1 is not prime for any k>0.
Known Brier numbers	3316923598096294713661 (A076335)	Numbers that are both Riesel and Sierpinski
Non-unique sums of two 4th powers	635318657 (see A003824)	= 133 ⁴ + 134 ⁴ = 59 ⁴ + 158 ⁴
Odd abundant numbers	945 (see A005231)	Odd number whose sum of proper divisors exceeds it
Sociable numbers	12496 (see A003416)	Its aliquot sequence terminates with a 5-member cycle
Largest of	1	
Narcissistic numbers	There are only 88 of them (A005188). max=	115132219018763992565095597973971522401
Not composed of two abundants	20161 (see A048242)	Exactly 1456 integers are the sum of two abundants
Consecutive 19-smooth numbers	11859210, 11859211 (see A002072)	In case you wonder: this pair was singled-out on MathWorld
	I	Favole the come of featonials of its deadinite
Factorions in base 10	40585 (see A193163)	Equals the sum of factorials of its dec digits

Right-truncatable prime in base 10	73939133 (see A023107)	Truncate any digits on the right and it's still a prime.
Right-truncatable primes in base 16	hex 3B9BF319BD51FF (see A237600)	Truncate any hex digits on the right and it's still a prime.
Left-truncatable prime with no 0 digit	357686312646216567629137 (A103443)	Each suffix is prime. Admitting "0", such primes never end.
Primes slicing only into primes	739397 (see A254751)	Prime whose decimal prefixes and postfixes are all prime.
Composites slicing only into primes	73313 (see A254753)	All its decimal prefixes and postfixes are prime.
Number of The Beast (Revelation 13:18)	666; also the 6x6-th triangular number, and	the largest left- and right-truncatable triangular number
Evil numbers (real) and evil integers	are two distinct categories	which must not be confused!
Belphegor numbers B(n)	16661, 1066601, 100666001, •••	prime for n=0, 13, 42, 506, 608, 2472, 2623, 28291, •••
Belphegor prime B(13).	100000000000066600000000000001	See A232448. Belphegor: one of the seven princes of Hell.
Smallest apocalyptic number	2 ¹⁵⁷ , a power of 2 containing dec.digits "666"	182687704666362864775460604089535377456991567872
Other Apocalyptic number exponents	157, 192, 218, 220, 222, 224, 226, 243, •••	m such that 2 ^m contains the sequence of digits "666"
Legion's number of the first kind L_1	666 ⁶⁶⁶	It has 1881 decimal digits
Legion's number of the second kind L_2	666! ^{666!}	It has approximately 1.609941e1596 digits
Some integer-valued functions of natural	numbers. Each constitutes also an integer sec	quence. Their domain {n=1,2,3,} can be often extended.
Aliquot sum function s(n)	0, 1, 1, 3, 1, 6, 1, 7, 4, 8, 1, 16, 1, 10, 9, •••	$s(n) = \sigma(n)$ -n. Sum of proper divisors of n.
Divisor function $d(n) \equiv \sigma_0(n)$		Number of all divisors of n. Also $S_{din}\{d^0\}$
• • • • • • • • • • • • • • • • • • • •	1, 2, 2, 3, 2, 4, 2, 4, 3, 4, 2, 6, 2, 4, 4, 5, •••	'
Euler's totient function φ(n)	1, 1, 2, 2, 4, 2, 6, 4, 6, 4, 10, 4, 12, 6, 8, ••• 1, 1, 1, 1, 2, 1, 2, 2, 2, 2, 4, 2, 4, 2, 4, 4, 8, •••	Number of k's smaller than n and relatively prime to it Pops up in counting the primitive roots of n
Iterated Euler's totient function φ(φ(n))		Also: permutations of ordered sets of n labeled elements
Factorial function n! = 1*2*3*n, but 0!=1 Hamming weight function Hw(n)	1, 1, 2, 6, 24, 120, 720, 5040, 40320, •••	<u> </u>
	1,1,2,1,2,2,3,1,2,2,3,2,3,3,4,1,2,	Number of 1's in the binary expansion of n
Liouville function \(\lambda(n)\)	1,-1,-1,1,-1,1,-1,-1,1,1,-1,-1,-1,1,•••	$\mu(n)=(-1)^{n}\Omega(n)$. For the <i>bigomega</i> function, see below.
Partial sums of Liouville function L(n)	0, 1, 0, -1, 0, -1, -2, -1, 0, -1, -2, -3, •••	The Polya conjecture, L(n>1)≤0, breaks at Tanaka's number.
Möbius function μ(n)	1, -1, -1, 0, -1, 1, -1, 0, 0, 1, -1, 0, -1, 1, 1, •••	$\mu(n)=(-1)^{\lambda}\omega(n)$ if n is squarefree; else $\mu(n)=0$
omega function ω(n)	0, 1, 1, 1, 1, 2, 1, 1, 1, 2, 1, 2, 1, 2, 2, 1, 1, •••	Number of <i>distinct</i> prime factors of n.
Omega (or bigomega) function Ω(n)	0, 1, 1, 2, 1, 2, 1, 3, 2, 2, 1, 3, 1, 2, 2, 4, 1, •••	Number of all prime factors of n, with multiplicity.
Primes sequence function prime(n)	2, 3, 5, 7, 11, 13, 17, 19, 23, 29, 31, 37, •••	A prime number is divisible only by 1 and itself; excluding 1
Primes counting function π(n)	0, 1, 2, 2, 3, 3, 4, 4, 4, 4, 5, 5, 6, 6, 6, 6, 6, 7, •••	π(x) is the number of primes not exceeding x. See A006880.
Primorial function n#	1, 1, 2, 6, 6, 30, 30, 210, 210, 210, 210, •••	Product of all primes not exceeding n
Sigma function $\sigma(n) \equiv \sigma_1(n)$	1, 3, 4, 7, 6, 12, 8, 15, 13, 18, 12, 28, 14, •••	Sum of all divisors of n. Also $\mathbf{S}_{\mathbf{d} \mathbf{n}}\{\mathbf{d}^1\}$.
Sigma-2 function σ ₂ (n)	1, 5, 10, 21, 26, 50, 50, 85, 91, 130, 122, •••	S _{d n} (d ²). Sum of squares of all divisors.
Sigma-3 function σ ₃ (n)	1, 9, 28, 73, 126, 252, 344, 585, 757, •••	In general, for $k \ge 0$, $\sigma_k(n) = \mathbf{S}_{d n} \{d^k\}$
Sum of distinct prime factors sopf(n)	0, 2, 3, 2, 5, 5, 7, 2, 3, 7, 11, 5, 13, 9, 8, •••	Example: $sopf(12) = sopf(2^2.3) = 2+3 = 5.$
Sum of prime factors with repetition sopfr(n)	0, 2, 3, 4, 5, 5, 7, 6, 6, 7, 11, 7, 13, 9, 8, •••	Also said with <i>multiplicity</i> . Example: sopfr(12) = 2+2+3 = 7.
Notable integer sequences (each of them is a	Iso an integer-valued function). Here $n = 0, 1, 2,$., unless specified otherwise.
Named sequences		
Catalan numbers C(n)	1, 1, 2, 5, 14, 42, 132, 429, 1430, 4862, ***	C(n) = C(2n,n)/(n+1); ubiquitous in number theory
•	1, 1, 2, 5, 14, 42, 132, 429, 1430, 4862, ••• 1, 3, 9, 25, 65, 161, 385, 897, 2049, •••	$C(n) = C(2n,n)/(n+1)$; ubiquitous in number theory $C_n = n.2^n+1$. Very few are prime.
Catalan numbers C(n)		
Catalan numbers C(n) Cullen numbers C _n	1, 3, 9, 25, 65, 161, 385, 897, 2049, •••	$C_n = n.2^n + 1$. Very few are prime.
Catalan numbers C(n) Cullen numbers C _n Cullen primes subset of C _n , for n =	1, 3, 9, 25, 65, 161, 385, 897, 2049, ••• 1, 141, 4713, 5795, 6611, 18496, 32292, •••	$C_n = n.2^n + 1$. Very few are prime. Largest known (Feb 2016): $n = 6679881$
Catalan numbers C(n) Cullen numbers C _n Cullen primes subset of C _n , for n = Euclid numbers 1+prime(n)#	1, 3, 9, 25, 65, 161, 385, 897, 2049, ••• 1, 141, 4713, 5795, 6611, 18496, 32292, ••• 2, 3, 7, 31, 211, 2311, 30031, 510511 •••	$C_n = n.2^n + 1$. Very few are prime. Largest known (Feb 2016): $n = 6679881$ $1 + (product of first n primes) = 1 + P_{k=1,n}\{prime(k)\}$
Catalan numbers C(n) Cullen numbers C _n Cullen primes subset of C _n , for n = Euclid numbers 1+prime(n)# Euler numbers E(n) for n = 0, 2, 4,	1, 3, 9, 25, 65, 161, 385, 897, 2049, ••• 1, 141, 4713, 5795, 6611, 18496, 32292, ••• 2, 3, 7, 31, 211, 2311, 30031, 510511 ••• 1, -1, 5, -61, 1385, -50521, 2702765, •••	$C_n = n.2^n + 1$. Very few are prime. Largest known (Feb 2016): $n = 6679881$ $1 + (product of first n primes) = 1 + P_{k=1,n}\{prime(k)\}$ $1/cosh(t) = S_{n \ge 0}\{t^n(E(n)/n!)\}$; the odd ones are 0
Catalan numbers C(n) Cullen numbers C _n Cullen primes subset of C _n , for n = Euclid numbers 1+prime(n)# Euler numbers E(n) for n = 0, 2, 4, Fermat numbers F(n)	1, 3, 9, 25, 65, 161, 385, 897, 2049, ••• 1, 141, 4713, 5795, 6611, 18496, 32292, ••• 2, 3, 7, 31, 211, 2311, 30031, 510511 ••• 1, -1, 5, -61, 1385, -50521, 2702765, ••• 3, 5, 17, 257, 655337, 4294967297, •••	$C_n = n.2^n + 1$. Very few are prime. Riesel numbers	509203 (?), •••	Numbers m such that m.2 ^k -1 is not prime for any k>0.
Sierpinsky numbers	78557, 271129, 271577, 322523, •••	Numbers m such that m.2 ^k +1 is not prime for any k>0.
Somos's quadratic recurrence s(n)	1, 1, 2, 12, 576, 1658880, •••	$s(0)=1,s(n)=n.s^2(n-1)$. See Somos 's constant
Sylvester's sequence	2, 3, 7, 43, 1807, 3263443, •••	$s_{n+1} = s_n^2 - s_n + 1$, with $s_0 = 2$. $\mathbf{S}_{k \ge 0} \{1/s_k\} = 1$.
Thabit numbers T _n	2, 5, 11, 23, 47, 95, 191, 383, 767, 1535, •••	3.2 ⁿ -1.
Thabit primes subset of Thabit numbers for n =	0, 1, 2, 3, 4, 6, 7, 11, 18, 34, 38, 43, 55, •••	As of Feb 2016, only 62 are known, up to n = 11895718.
Wolstenholme numbers	1, 5, 49, 205, 5269, 5369, 266681, •••	Numerators of the reduced rationals $S_{k=1}$ $_{n}\{1/k^{2}\}$
Woodall numbers (Cullen of 2nd kind), W _n	1, 7, 23, 63, 159, 383, 895, 2047, 4607, •••	$W_n = n.2^n - 1$, $n = 1, 2, 3,$ Very few are prime
Sequences related to Factorials (maybe just in some		Trip in 2 1,11 1,2,5, rely few die printe
Double factorials n!!	1, 1, 2, 3, 8, 15, 48, 105, 384, 945, 3840, •••	$0!!=1$; for $n > 0$, $n!! = n^*(n-2)^*(n-4)^*^*m$, where $m \le 2$
Triple factorials n!!! or n! ³ , n = 1,2,3,	1, 1, 2, 3, 4, 10, 18, 28, 80, 162, 280, 880, •••	$0!!!=1$; for $n > 0$, $n!!! = n*(n-3)*(n-6)**m$, where $m \le 3$
Exponential factorials a(n)	1, 1, 2, 9, 262144, •••	$a(0)=1$; for $n > 0$, $a(n) = n^{a(n-1)}$. Next term has 183231 digits
Factorions in base 10	1, 2, 145, 40585 (that's all)	Equal to the sum of factorials of their dec digits
Factorions in base 16	1, 2, 2615428934649 (that's all)	Equal to the sum of factorials of their hex digits
Hyperfactorials $H(n) = P_{k=1,n}\{k^k\}$	1, 1, 4, 108, 27648, 86400000, •••	H(0) is conventional
Quadruple factorials (2n)!/n!	1, 2, 12, 120, 1680, 30240, 665280, •••	Equals (n+1)!C(n), C(n) being the Catalan number
Pickover's tetration superfactorials (n!^^n!)/n!	1, 1, 4, (incredible number of digits),	Here the term 'superfactorial' is deprecated
Subfactorials !n = n!* $\mathbf{S}_{k=0.n}\{(-1)^k/k!\}$	1, 0, 1, 2, 9, 44, 265, 1854, 14833, •••	Also called derangements or rencontres numbers
Superfactorials $n\$ = P_{k=0,n}\{k!\}$	1, 1, 2, 12, 288, 34560, 24883200, •••	Prevailing definition (see below another one by Pickover)
Sequences related to the Hamming weight function	1, 1, 2, 12, 200, 04000, 24000200,	The validing definition (see below another one by his lower)
Evil integers (but see also)	0, 3, 5, 6, 9, 10, 12, 15, 17, 18, 20, 23, 24, •••	Have even Hamming weight Hw(n)
Odious numbers	1, 2, 4, 7, 8, 11, 13, 14, 16, 19, 21, 22, 25, •••	Have odd Hamming weight Hw(n)
Primitive odious numbers	1, 7, 11, 13, 19, 21, 25, 31, 35, 37, 41, 47, •••	They are both odd and odious
Pernicious numbers	3, 5, 6, 7, 9, 10, 11, 12, 13, 14, 17, 18, 19, •••	Their Hamming weights Hw(n) are prime.
Sequences related to powers	3, 5, 6, 7, 9, 10, 11, 12, 13, 14, 17, 16, 19,	Their Hamming weights riw(ii) are prime.
Narcissistic Armstrong Plus perfect numbers	1,2,3,4,5,6,7,8,9, 153, 370, 371, 470, 1634, •••	n-digit numbers equal to the sum of n-th powers of their digits
Powers of 2	1, 2, 4, 8, 16, 32, 64, 128, 256, 512, 1024, •••	Also 2-smooth numbers
Perfect powers with duplications	4, 8, 9, 16, 25, 27, 32, 36, 49, 64, 81, 100, •••	Includes any number of the form a^b with a,b > 1
Perfect powers with duplications	4, 8, 9, 16, 16, 25, 27, 32, 36, 49, 64, 64, •••	Repeated entries can be obtained in different ways
Perfect squares	0, 1, 4, 9, 16, 25, 36, 49, 64, 81, 100, 121, •••	Same as figurate polygonal square numbers
Perfect cubes	0, 1, 8, 27, 64, 125, 216, 343, 512, 729, •••	Same as figurate polyhedral cubic numbers
Taxicab numbers Ta(n); only six are known	2, 1729, 87539319, 6963472309248, •••	Smallest number equal to a^3+b^3 for n distinct pairs (a,b).
Sequences related to divisors . For functions like $\sigma(n)$ is	1	T
Abundant numbers	12, 18, 20, 24, 30, 36, 40, 42, 48, 54, 56, •••	Sum of proper divisors of n exceeds n: s(n) > n
Primitive abundant numbers	20, 70, 88, 104, 272, 304, 368, 464, 550, •••	All their proper divisors are deficient
odd abundant numbers	945, 1575, 2205, 2835, 3465, 4095, •••	Funny that the smallest one is so large
odd abundant numbers not divisible by 3	5391411025, 26957055125, •••	see also A047802
Composite numbers	4, 8, 9, 10, 14, 15, 16, 18, 20, 21, 22, 24, •••	Have a proper divisor d > 1
highly composite numbers	1, 2, 4, 6, 12, 24, 36, 48, 60, 120, 180, •••	n has more divisors than any smaller number
Cubefree numbers	1, 2, 3, 4, 5, 6, 7, 9, 10, 11, 12, 13, 14, 15, •••	Not divisible by any perfect cube.
Deficient numbers	1, 2, 3, 4, 5, 7, 8, 9, 10, 11, 13, 14, 15, 16, •••	Sum of proper divisors of n is smaller than n: s(n) < n
Even numbers	0, 2, 4, 6, 8, 10, 12, 14, 16, 18, 20, 22, 24, •••	Divisible by 2
Odd numbers	1, 3, 5, 7, 9, 11, 13, 15, 17, 19, 21, 23, 25, •••	Not divisible by 2
Perfect numbers	6,28,496,8128,33550336,8589869056, •••	Solutions of s(n) = n
semiperfect / pseudoperfect numbers	6, 12, 18, 20, 24, 28, 30, 36, 40, 42, 48, •••	n equals the sum of a subset of its divisors
primitive / irreducible semiperfect numbers	6, 20, 28, 88, 104, 272, 304, 350, 368, •••	Semiperfect with no proper semiperfect divisor
quasiperfect numbers	Not a single one was found so far!	Such that $s(n) = n+1$ or, equivalently, $\sigma(n) = 2n+1$
superperfect numbers	2, 4, 16, 64, 4096, 65536, 262144, •••	Solutions of $n = \sigma(\sigma(n)) - n$
Practical numbers	1, 2, 4, 6, 8, 12, 16, 18, 20, 24, 28, 30, 32, •••	Any smaller number is a sum of distinct divisors of n
Squarefree numbers	1, 2, 3, 5, 6, 7, 10, 11, 13, 14, 15, 17, 19, •••	Not divisible by any <i>perfect square</i> . Equivalent to μ(n) ≠ 0
Untouchable numbers	2, 5, 52, 88, 96, 120, 124, 146, 162, 188, •••	They are not the sum of proper divisors of ANY number
Weird numbers	70, 836, 4030, 5830, 7192, 7912, 9272, •••	Abundant, but not semiperfect
Sequences related to the aliquot sequence As(n), As		<u>'</u>
Amicable number pairs (n,m)	(220,284); (1184,1210); (2620,2924); •••	m = s(n), n = s(m); As(n) is a cycle of two elements
Aspiring numbers	25, 95, 119, 143, (276? <i>maybe!</i>), •••	n is not perfect, but As(n) eventually reaches a perfect number.
Lehmer five numbers	276, 552, 564, 660, 966	First five n whose As(n) <i>might</i> be totally a-periodic.
Sociable numbers	12496, 14316, 1264460, 2115324, •••	As(n) is a cycle of C > 2 elements; see also A052470.
		, ,

Achilles numbers	72, 108, 200, 288, 392, 432, 500, 648, •••	Powerful, but not perfect.
Carmichael's pseudoprimes (or Knödel C ₁)	561, 1105, 1729, 2465, 2821, 6601, •••	Composite n such that a ⁿ⁻¹ =1 (mod n) for any coprime a <n< td=""></n<>
D-numbers (Knödel numbers C _k for k=3)	9, 15, 21, 33, 39, 51, 57, 63, 69, 87, 93, •••	Composite n such that a ^{n-k} =1 (mod n) for any coprime a <n< td=""></n<>
Euler's pseudoprimes in base 2	341, 561, 1105, 1729, 1905, 2047, 2465, •••	Composite odd n such that $2^{(n-1)/2} = \pm 1 \pmod{n}$
	2, 4, 6, 12, 18, 23, 30, 37, 42, 47, 53, 60, •••	Either an isolated prime or the mean of twin primes.
Isolated (single) numbers		Some $M(p) = 2^p - 1$; p prime; Largest known: $M(74207281)$
Mersenne primes (p = 2,3,5,7,13,17,19,)	3, 7, 31, 127, 8191, 131071, 524287, •••	
Powerful numbers (also squareful or 2-full)	1, 4, 8, 9, 16, 25, 27, 32, 36, 49, 64, 72, •••	Divisible by the squares of all their prime factors.
3-full numbers (also cubeful)	1, 8, 16, 27, 32, 64, 81, 125, 128, 216, •••	Divisible by the cubes of all their prime factors.
Prime twins (starting element)	3, 5, 11, 17, 29, 41, 59, 71, 101, 107, •••	For each prime p in this list, p+2 is also a prime
Prime cousins (starting element)	3, 7, 13, 19, 37, 43, 67, 79, 97, 103, 109, •••	For each prime p in this list, p+4 is also a prime
Prime triples (starting element)	5, 11, 17, 41, 101, 107, 191, 227, 311, •••	For each prime p in this list, p+2 and p+6 are also primes
Prime quadruples (starting element)	5, 11, 101, 191, 821, 1481, 1871, 2081, •••	For each prime p in this list, p+2, p+6, p+8 are also primes
Primorial numbers prime(n)#	1, 2, 6, 30, 210, 2310, 30030, 510510, •••	Product of first n primes
Pseudoprimes to base 2 (Sarrus numbers)	341, 561, 645, 1105, 1387, 1729, 1905, •••	Composite odd n such that 2 ⁿ⁻¹ = 1 (mod n)
Pseudoprimes to base 3	91, 121, 286, 671, 703, 949, 1105, 1541, •••	Composite odd n such that 3 ⁿ⁻¹ = 1 (mod n)
Semiprimes (also biprimes)	4, 6, 9, 10, 14, 15, 21, 22, 25, 26, 33, 34, •••	Products of two primes.
3-smooth numbers	1, 2, 3, 4, 6, 8, 9, 12, 16, 18, 24, 27, 32, •••	b-smooth numbers: not divisible by any prime p > b
Pierpont primes	2, 3, 5, 7, 13, 17, 19, 37, 73, 97, 109, 163, •••	Primes p such that p-1 is 3-smooth
Thabit primes (so far, 62 are known)	2, 5, 11, 23, 47, 95, 191, 383, 6143, •••	Thabit number 3.2 ⁿ -1 which are also prime
Wieferich primes	1093, 3511, ••• (next, if any, is > 4.9e17)	Primes p such that 2^(p-1)-1 is divisible by p ²
Wilson primes	5, 13, 563, ••• (next, if any, is > 2e13)	Primes p such that ((p-1)!+1)/p is divisible by p
Wolstenholme primes	16843, 2124679, ••• (next, if any, is > 1e9)	Primes p such that C(2p,p)-2 is divisible by p ⁴
Sequences related to partitions and compositions	•	
Polite numbers staircase numbers	3, 5, 6, 7, 9, 10, 11, 12, 13, 14, 15, 17, 18, ***	Can be written as sum of two or more consecutive numbers.
Politeness of a number	0, 0, 1, 0, 1, 1, 1, 0, 2, 1, 1, 1, 1, 1, 3, 0, •••	Number of ways to write n as a sum of consecutive numbers
Other notable sequences	•	
Hungry numbers (they want to eat the π)	5, 17, 74, 144, 144, 2003, 2003, 37929, •••	Smallest m such that 2 ^m contains first m digits of π
Combinatorial numbers such as Pascal-Tartag		
Binomial coefficients C(n,m) = n!/(m!(n-m)!) (ways to		1
m = 2, n = 4,5,6,	6, 10, 15, 21, 28, 36, 45, 55, 66, 78, 91, •••	n(n-1)/2; s hifted triangular numbers
m = 3, n = 6,7,8,	20, 35, 56, 84, 120, 165, 220, 286, 364, •••	n(n-1)(n-2)/3!; shifted tetrahedral numbers

Notes

Purpose

Since every number is a math constant, there can not exist any list containing them all.

Yet some numbers catch our fancy because they were studied in more detail than others (historic importance) and such studies uncovered unusual, even counter-intuitive, aspects (with the reasons being often related more to human mind than to the numbers themselves). Learning about such numbers is fun and - maybe - teaches us something about ourselves.

The main purpose of this selection is to **stimulate curiosity** and the desire to study Math.

This collection started with just a few real numbers in mind, but it soon grew and branched into various categories. Presently, real, complex, integer, and rational numbers are all represented. I have even included some transfinite numbers and might soon include examples of quaternions, tensors, spinors, matrices, etc.

Recently, I have added some integer sequences which look fundamental to me from the educational and/or math-recreative point of view (I have no intention to compete with OEIS, of course; that would be foolish). Another new category, perhaps more 'utilitarian', is represented by special points and values related to important mathematical functions. Both initiatives are far from complete. Work in progress ...

Truncated values

Real values are truncated after the last shown digit, not rounded.

Complex-valued constants

are listed with their real part in the central column and imaginary part in the right column (otherwise reserved for notes).

Logarithms

Natural logarithm of x is written as log(x), while log(x) denotes the decadic one, and a logarithm in base b is $log_b(x)$.

Format of Limits (L), Sums (S), Products (P), and Integrals (I)

The general format is O_{range} (expression), where O is an operation-defining capital letter (bold italics).

The range can be something like "min, max", or a condition, such as "prime p>2".

Conditions $k \ge m$; and k > m stand for k = m, m+1, m+2, ..., ∞ and k = m+1, m+2, ..., ∞ , respectively. In the case of limits, the formats used may be "x \rightarrow c" or "x \rightarrow ∞ ", or similar.

Operator expressions using the symbol

A construct like f(a,#) = (#+a/#)/2 denotes an operator, rather than a function. Thus f(a,#)(x) = (x+a/x)/2 is the application of the operator to (x), where x may be a variable, an expression, a quaternion, a matrix, anything. The difference between the operator f and the function f is best seen in repeated applications:

 $f^2(a,\#) = f(a,\#)(f(a,\#)) = (f(a,\#) + a/f(a,\#))/2 = ((x+a/x)/2 + a/((x+a/x)/2))/2$ which is different from the usual $f^2(x) = ((x+a/x)/2)^2$.

This permits to simplify statements regarding attractors of mappings, such as $A_{(0,\infty)}\{(\#+a/\#)/2\} \equiv L_{n=1,\infty}\{f^n(a,\#)\} = \sqrt{a}$.

Attributions of named constants

In a few cases I have taken the liberty of associating a name to a previously unnamed constant. I sincerely hope that these attributions will stick since, whenever they refer to persons, they acknowledge merit. They include:

- Knuth's constant: The ratio c/m in congruence random-number generators of the type $X_{n+1} = (aX_n + c) \mod (m)$ which minimizes the correlation between successive values. See Knuth 1997, Section 3.3.3, Equation 41.
- Chandrasekhar's constants (1st and 2nd): Originally related to nearest-neighbor statistics in an ideal gas, but having a much more general significance for any 3D, uniformly random distributions of points.
- Cannery constant, Cooking pot constant, Frozen cone constant, and Teepee constant: Four constants related to the minimum-surface indices of closed and open bodies. The derivations of these constants are nice exercises in elementary analysis. I think that giving them funny names might help math acceptance by non-mathematicians in everyday life.
- Blazys constant: a recent prime-numbers generating constant which struck the imagination of many people.
- Graham's constant: Rationalization of the fact that hyperpowers $n^{M}k$ of a number n (3 in this case), for any $k \ge m$, have all the same (m-2) trailing digits $d_{m-2}d_{m-2}...d_1d_0$. Writing the digits in reverse order as $0.d_0d_1d_2...$, and letting $k \rightarrow \infty$, one has a mathematically rigorous definition of a constant. See OEIS A133613.
- Tanaka's number, the first n>2 violating Polya's conjecture. It represents a deeply educational warning that no number of mere empirical 'tests' can replace a proof. Though violations of Polya's conjecture were known already before Tanaka's work, the determination of the first one was important. See OEIS A189229.

Links to OEIS, the Online Encyclopedia of Integer Sequences

Three bold dots after a value are a link to the OEIS database (OEIS accepts as integer sequences also decimal expansions of real-valued constants). The OEIS entries usually extend the values listed here (unless the sequence is finite and listed in full, and provide more references). I have registered a few OEIS entries myself, and I think that everybody who hits on a nice constant or integer sequence should do so as well.

Many links, other than those to OEIS and/or those appearing below,

are scattered through the text, accompanying the particular constants. This is an important feature, to be intensified.

Feedback:

If you think a link, or a constant, are missing, please, let me know. Such suggestions are most appreciated.
